BioLector® Pro
Microfluidic Bioprocess Control

32 Parallel Microbioreactors
pH Control
Continuous Feeding
Online Monitoring
Scalability
The BioLector® Pro is the first microbioreactor system combining the established BioLector® technology with an innovative microfluidic chip.

The system is based on a standard microtiter plate format and operates with non-invasive, optical sensors. The disposable 48 well microtiter plate of the BioLector® Pro features online measurements of biomass, fluorescence, pH and DO and simultaneously controls the pH and feeding rates through micro-valves and microfluidic-channels. For the first time, these unique microfluidic components allow continuous feeding and pH control in standard microtiter plates. There is no tubing and no liquid handling needed anymore; everything is part of the gamma radiated ready-to-use plate!

### Applications

- Fed-batch development
- pH profiling
- Feeding rate optimization
- Media screening and optimization
- Fermentation parameter optimization
- Cell line and strain screening
- Anaerobic and microaerophilic fermentations
- Synthetic and systems biology
- Statistical design of experiments (DoE)
- Growth characterization
- High-throughput protein expression
- Enzyme and cell activity tests
- Functional genomics
- Proteomic studies
- Inhibition and toxicity tests
- Quality control

### Measurements

![Graph 1](image1.png)

**E. coli** (two triplicates using different P&I settings) WR medium, 37°C, 800 rpm, pH$_{init}$ = 6.4, One-sided pH control (NaOH), feeding rate = 5 μL/h Glucose (500g/L), Start feed at 5h, Round Well Plate

**BioLector® Pro – E. coli** Fed-batch Fermentation

**Batch**

**Fed-batch**

Constant feed (N=6)
32 Parallel Microbioreactors

Features

Online Measurement
- Biomass concentration
- pH value
- Dissolved oxygen (DO)
- NAD(P)H and riboflavins
- Fluorescent molecules (GFP, YFP, DsRed ...)
- Temperature
- Humidity
- O₂ in head space atmosphere
- CO₂ in head space atmosphere

Online Control
- pH value
- Feeding
- Shaking speed
- Temperature
- Humidity
- O₂ in head space atmosphere
- CO₂ in head space atmosphere

System Performance
- Working volume of 800 – 2400 µL
- 32 parallel microreactions
- 16 reservoir wells
- Individual pH control
- Continuous individual feeding
- No foaming problems
- Broad range of k_a values (25 – 600 1/h)
- Continuous gas exchange and oxygen supply
- Equal power input to each reactor
- Defined engineering parameters and scalability
- Controlled gas atmosphere (CO₂, O₂ and N₂)
- Feeding modes: constant, linear, exponential or signal triggered

Operating Principle

Microfluidic Control on a FlowerPlate® with Optodes
Smaller and Smarter

Advantages

• Real time kinetics in 32 parallel fermentations
• Microfermentation in standard MTP format
• Batch and fed-batch cultivation
• Control of pH on-the-plate
• Continuous controlled feeding on-the-plate
• DO- and signal-triggered feeding
• High-throughput and easy automation
• Broad linear range for biomass detection (up to 100 g/L CDW, 600 OD)
• Small volume (800 – 2400 µL)
• Excellent reproducibility (CV < 5 %)
• No edge effects
• Continuous shaking operation (no artefacts)
• Defined mass transfer conditions (no O₂-limitation)
• Reliable scale up to benchtop fermenters
• Industry leading data analysis software
• Fast and easy data analysis included
• A valuable tool for PAT and QbD

Note: The BioLector® Pro includes the BioLection software pre-installed on a notebook.

It is possible to combine all types of modules (O₂, CO₂, FRET) in one device.
The Company

m2p-labs is a worldwide leading supplier of microbioreactors.

The company focuses on microreaction and automated solutions for screening and bioprocess development. The microfermentation technology enables customers to conduct experiments with greater efficiency, better quality and lower cost than in any other cultivation platform. More knowledge from small scale leads to more rational and reliable decisions in the development of bioprocesses.

PRODUCT PORTFOLIO

Systems
The BioLector® microbioreactor is a unique high-throughput fermentation system. In up to 48 parallel cultures the essential fermentation parameters such as biomass concentration, pH and DO as well as fluorescent proteins or substrates can be all monitored online. The advanced BioLector® Pro technology is using proprietary microtiter plates with an integrated microfluidic chip. By using the microfluidic technology, the system continuously controls the pH of each culture individually as well as the feeding for fed-batch cultivations. The BioLector® microbioreactors are established systems for bacterial, yeast, fungal, plant and insect cells. All systems are suitable for aerobic, microaerophilic and strict anaerobic cultivations.

Disposables
m2p-labs provides worldwide unique microtiter plates with improved oxygen transfer and excellent mixing properties. Due to its design, the FlowerPlate® supplies microbial cultures even with high oxygen demands with a sufficient amount of oxygen. In addition, the proprietary microfluidic plate uses 16 donor wells for online feeding and pH control. The round well plate delivers moderate oxygen transfer for organisms with lower demand in oxygen or organisms sensitive to shear stress. All plates are available with different optical sensors for different applications.

Automation
The RoboLector® provides an unique automated cultivation platform combining the high-throughput fermentation and the online monitoring capability of the BioLector® with the very accurate and reproducible pipetting of a liquid handling robot. The system is used for media preparations, automated sampling and dosing steps, inductions and fed-batch processing.
